Isolated +5V and +3.3V.
Use GND as local gnd for all board electronic components.
Connect GNDPWR when using +12V.

Check levels of coin cell battery without
having the led constantly consume power.

Version History
–v2.1, Remove the external RTC.
There's no need to use an external RTC on the telemetry board. The microcontroller itself has an internal RTC that can be powered from the VBAT line and a 32.768kHz oscillator. Courtesy of Chase!
–v2.2, Standardization and cleanup!!

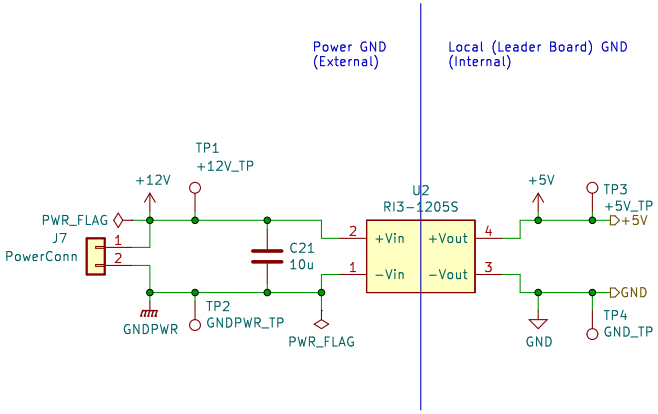
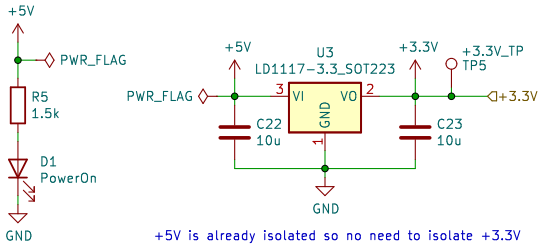
ISOLATED



Isolated DC-DC Converter to step down +12V power to an isolated +5V. The input gnd (Power GND) is different from the output gnd (Local GND)



+5V is already isolated so no need to isolate +3.3V

Linear Regulator to step down +5V to +3.3V. An isolated converter was not used for the +3.3V line because of price and space. May need to change this to DC-DC converter if we really want to make the BPS more energy efficient.

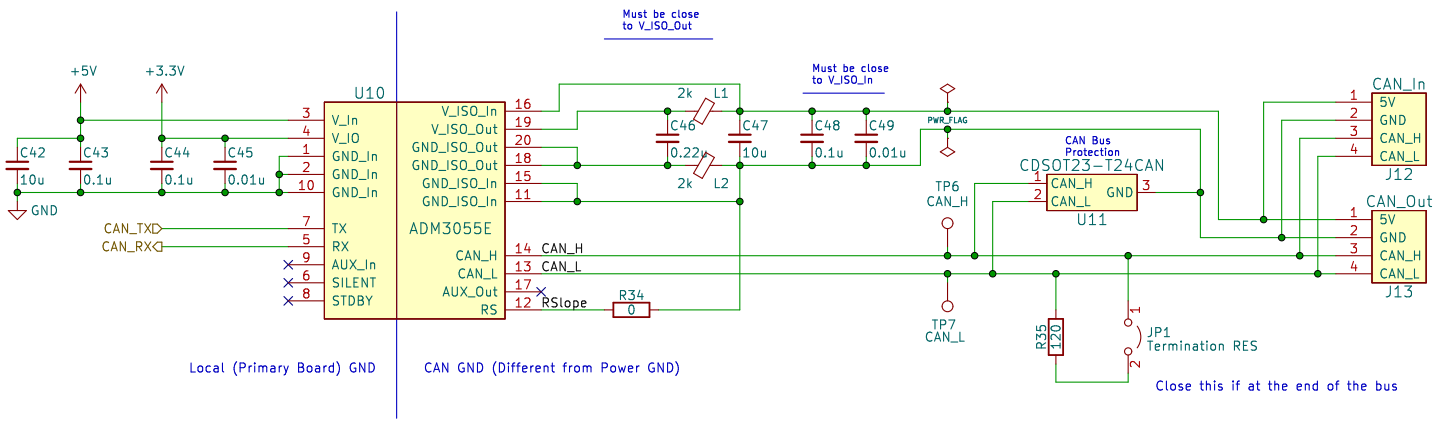
ISOLATED



Isolated CAN transceiver. This connects to the main electrical system's CAN bus. Look in datasheet for more information about this page.
